

Kreb Cycle High

The Carbon Sorority

Glycolisis Middle School

- Located in the cytoplasm
- 6 carbs – best buds
- Argument, they split up into 2 pyruvic acid groups; as one pyruvic acid group approaches MHS, an Oxygen sweeps one of them off her feet (CO₂ is formed) – talks her into skipping before they even started
- Now we have the Acetyl- CoA group

Mitochondrian High School

- Greeted by the 4 (Oxaloacetic Acid) Carbon's and they take them around the school
- Before they even get around the first locker bank at south house – an Oxygen is waiting in the corner to trick another freshmen in to leaving – and he did.(CO₂ is formed) This causes the vice principle NAD to come out and be formed and he gave a H⁺.
- Now there are only 5 carbons left, they warn the last freshmen to not listen to those oxygens and to stay with them.
- As they approach the locker bank in West house, there was oxygen waiting to prey upon the innocent freshmen carbon. But this was different – they fell in love – and created ATP out of ADP and created energy. This new CO₂ being formed caused the West House Asst. Principle Mr. NAD to come out and issue another – H⁺ Detention
- Now the 4 senior officers had lost all of their freshmen Carbons, you can't have a freshmen class with no freshmen. The FAD police liaison officer was very upset and assigned a H detention.
- Being very upset, they marched off to Northhouse to report into Asst principle NAD hoping that he would understand and take away the H detention that was given to them by Officer FAD – but when they got there another H⁺ detentions was issued for wasting Asst. principals NAD time.

Electron Transport Chain – Hydrogen pump

- Make the membrane in the classroom –
